Dear Hiring Team at AppZoro Technologies Inc.,

I am writing to apply for the Manual Tester/QA role at AppZoro Technologies in Jaipur. I am a Computer Science graduate specializing in Data Science, and through my internships and projects I have developed a strong interest in software testing, finding issues early, and making applications more reliable. I have hands-on experience with Python, Selenium, SQL, Flask, REST APIs, and web application testing.

During my internship at IIIT Naya Raipur, I worked on automated validation workflows and regression test scenarios using Python and Pandas. I compared expected and generated outputs against defined validation criteria, investigated inconsistencies, and used debugging and iterative testing to improve system reliability. This experience helped me develop a more structured approach to testing and paying attention to small issues that can affect overall application quality.

At Deloitte Australia, I worked with Python and SQL to perform data validation and reconciliation across multiple datasets. I investigated discrepancies and improved verification workflows, reducing manual validation effort by 40%. This also strengthened my analytical and problem-solving skills and taught me the importance of accurate, well-documented validation.

My projects have given me practical experience with web application testing as well. In Gen-FIR, I developed a Flask-based web application and worked on test scenarios covering input validation, functional workflows, error handling, database operations, regression testing, and output verification. In PhishBuster, I used Selenium to automate key UI workflows and tested valid, invalid, boundary, and edge-case inputs to identify inconsistencies and potential defects.

I am comfortable with functional and regression testing, test case development, SQL and database validation, Selenium-based UI testing, REST API validation, debugging, and software development processes including SDLC and STLC. I also have a good foundation in object-oriented programming, DBMS, software engineering, and Agile practices. I am familiar with Jira fundamentals and am keen to continue developing my skills in defect tracking, test documentation, and QA processes.

What interests me about AppZoro is the opportunity to work on real web and mobile products where testing has a direct impact on the user experience. I would be excited to work closely with developers and product teams, learn from experienced QA professionals, and contribute to thorough testing and continuous improvement of your applications.

Thank you for considering my application. I would appreciate the opportunity to discuss my experience and interest in the role further.

Sincerely,

Divya A Kumar
