**Dear Hiring Team at Barclays,**

I am writing to apply for the Software Development Engineer in Test role at Barclays. I am a Computer Science undergraduate with a strong interest in software quality, automation, and building reliable applications. Through my projects and internships, I have gained practical experience with Python, Java, Selenium, SQL, Git, GitHub Actions, and automated validation workflows.

During my internship at IIIT Naya Raipur, I built automated data validation workflows and regression test scenarios using Python and Pandas. I worked with expected outputs, validation thresholds, and debugging processes to identify inconsistencies and improve system reliability. At Deloitte Australia, I developed automated Python and SQL checks for multi-source datasets, reducing manual validation effort by 40%.

My projects have also given me hands-on testing experience. In Gen-FIR, I developed a Flask-based web application and worked on input validation, regression scenarios, error handling, output verification, and quality checks. In PhishBuster, I used Selenium to automate important web application workflows and created test scenarios covering different inputs and application behaviour.

I am comfortable with Java, Python, Selenium, SQL, Git, GitHub Actions, Flask, REST APIs, and object-oriented programming, with a strong foundation in software engineering, DBMS, data structures, and SDLC concepts. I am particularly interested in growing my skills in automation frameworks, CI/CD, and continuous testing while working alongside experienced engineers.

Barclays appeals to me because the role combines software development with quality engineering in an environment where reliability and secure, well-tested software are important. I would welcome the opportunity to learn, contribute to automation efforts, and grow as an SDET at Barclays.

Thank you for considering my application. I look forward to the opportunity to discuss my experience further.

Sincerely,

Divya A Kumar
